

Controllers and Views lab

Objectives:

The goal is to help students understand how data moves between Controllers and Views, how routing works, and how layout pages can be used.

Title: Student Portal

Main Features:

1. Welcome Page (Student/Welcome)

- This is the **default route**.
- Displays a message like:

“Welcome to the Student Portal”

- Includes a button **“View Students”** that takes the user to the list of students.

2. Students List Page (Student/Index)

Uses a **static list** of students inside the controller:

```
private static List<string> students = new List<string>
{
    "Sara", "Omar", "Lina", "Ahmed"
};
```

The page displays all student names (in a table or cards).

Next to each name, there's a **“Details”** button that links to a details page.

3. Student Details Page (Student/Details)

- Receives the student's name as a parameter.
- Displays:

“Student Name: Sara”

- Includes a **“Back to List”** button.

4. Add Student Page (Student/Add)

- A simple form with one text input for the student's name.

- When the user clicks “Add”, the name is added to the **static list**, then the user is redirected to the student list page to see the updated list.

Layout and Design Ideas [Here’s your creative space, feel free to make whatever you like! :)]

- Use **_Layout.cshtml** for a shared structure:
 - Navigation bar with links: **Home | Students | Add Student**
 - Add a small logo or title “Student Portal”
 - Footer like “© 2025 Student Portal”
- Play a bit with the layout using Bootstrap or simple CSS:
 - Soft background color
 - Rounded buttons
 - Responsive table or card layout

Routing Flow:

- Default route → /Student/Welcome
- “View Students” button → /Student/Index
- “Details” button → /Student/Details/{name}
- “Add Student” button → /Student/Add
