

Systems Analysis and Design Course- Lab 1

SDLC Phases Overview

Your team works for a small software company. A local business has approached you to develop a system that solves a real problem.

Examples (choose one):

1. Library Management System
2. Online Food Ordering System
3. Student Attendance System
4. Appointment Booking System
5. Recycling Collection Tracking System

Each group must walk through the **SDLC phases** to propose how they will develop this system.

Tasks and Deliverables:

Phase 1: Planning

- Define the **problem** your system will solve.
- Identify the **goals** and **expected benefits** of the project.
- Define the **stakeholders**.
- *Deliverable*: Short project proposal (1 paragraph)

Phase 2: Analysis

- List **functional requirements** (what the system should do).
- List **non-functional requirements** (performance, security, etc.).

Phase 3: Design

- Sketch a **simple interface** (paper or digital).
- Describe **how data will be stored** (basic ERD or table structure).
- *Deliverable:* Interface sketch + design notes

Phase 4: Implementation

- Describe **which technologies** you would use (e.g., web app, database, etc.).
- Mention **how team roles** will be divided (developer, tester, analyst, etc.).
- *Deliverable:* Implementation plan (short paragraph)

Phase 5: Testing

- List **three test cases** you would use to verify the system's correctness.
- *Deliverable:* Test case table (e.g., input, expected output, actual result)

Phase 6: Deployment & Maintenance

- Explain **how you would deploy** the system to users.
- Describe **one possible maintenance activity**.
- *Deliverable:* Deployment and maintenance plan
